

**EAB** ENERGY  
 ABSORBING  
 BOLLARD

*Prevents vehicle access to public places.*

**Ultimate Control and Protection for Parking Facilities**

The EAB20 has been successfully tested to an impact speed of 20kph and fully complies with AS 2890 for Parking Facilities, the performance of non-tested bollards is unknown. Your typical Decorative Bollards are surface mounted or buried 200-300 mm below the ground and frequently with no concrete or steel reinforcement. This will make them incapable to stop vehicles even at speed of 5-10 kph. They can also be dangerous when impacted by an out of control vehicle, as they can become flying projectiles and possibly injure pedestrians.
